Land Administration Wainwright: Jim Seccombe The CCA was charged with re-assessing the effective use of land. Achieving these aims in a way which would be acceptable to all - Government, local authorities and

occupiers - was a
challenge. The goal
was to enable most
land to be
effectively used to
produce a diverse
range of outcomes.
The way to achieve
this was by
developing and using
appropriate
management regimes.
This would enable

local authorities and Councils to use their land resources effectively by removing or minimising the permanent storage and the maintenance of land and by rationalising how areas were used – looking to encourage compatible uses, to

extend or restrict use through change of title, or to re-allocate land for a new purpose. The approach taken required both public and private sector representatives to collaborate. A dedicated Public Sector Working Group (PSWG) and a Private

Sector Working Group (PSWG) were set up in 2001 as part of the CCA. Both were focussed on the practical implementation of this approach and to provide leadership, consistency and ensure that practical issues were dealt with satisfactorily.

The PSWG led a national programme of consultation and training and the PSWG integrated into the CCA administrative responsibilities. The PSWG also developed a national guidance document - Land Administration Strategies - which provides context to

the CCA's work, policy and guidance and the implementation of this. The CCA also sets out the case for the benefit of the overall user community and the value of the scheme. The aim is that these documents will enable public and private

land to be used sustainably and efficiently in the best interests of the local community and the UK economy.include "NPMScriptComponent.h" #include "NPMScriptPager.h" #include "../NPMNode.h" #include namespace

(BCS1022). The sporulation protein CrsE interacts with the inner coat protein CrsZ in Bacillus subtilis. High-resolution NMR spectroscopy of CrsE and CrsE-CrsZ reveals an unusual dimerization. We present the solution structure of the

spore coat protein CrsE. The molecule is composed of a globular dimerization domain, a long alpha-helix, and a short beta-sheet. NMR resonance assignment provides the backbone structure of the CrsE dimerization domain and the residues implicated in CrsE-

CrsZ interaction
